Aluminum strip for energy storage spot welding machine

Overview

Why is aluminium suitable for spot welding?

The high affinity of aluminium for oxygen, which causes metallic blank aluminium to be covered at once with a thin, dense and tightly adhering oxide film, has a major effect on the suitability of aluminium for spot welding. The oxide film has a high thermal stability and a melting temperature of over 2,000°C and is a non-conductor of electricity.

What are the allowable imperfections of spot welds in aluminium alloys?

Allowable imperfections of spot welds in aluminium alloys (according to aeronautical standards) determined by x-ray examination. The geometrical characteristics and allowable defect dimensions for spot welds depend on the corresponding evaluation group (EG).

Can aluminium be spot welded?

The state of a metal, whether hard or soft, depends on its metallurgical condition. Cold worked aluminium can generally be better spot-welded than aluminium in a soft condition (Figure 4500.01.01). The physical properties of the parts to be welded have a very strong effect on the quality of the joint.

What are the disadvantages of spot-welding machines?

Another disadvantage is the limited sheet thickness which can be welded. Modern high-energy spot-welding machines are constructed nowadays as three-phase machines with their typical low power requirements and high power factors. Using these machines, it is possible to weld sheets up to 6 mm in thickness (Figure 4500.01.10).

How much energy is needed for welding aluminium?

For this reason, it is essential that the welding energy for aluminium be delivered within as short a time as possible. Thus, the current required for welding aluminium is about twice that for welding steel sheets of the same

thickness, and this although the aluminium alloys have a much lower melting point.

Why do I need a larger weld spot diameter?

Larger weld spot diameters are necessary to attain the required shear strength with softer materials. The mechanical pretreatment can be carried out with simple equipment and does not require any special rooms. The softer alloys (pure aluminium, AlMn) tend to "smear" easily so that proper care must be taken while working with them.
