## Overview

How does electric energy storage work in a braking system?

Since the energy storage capacity of battery is much greater than the coil spring, the electric energy storage method always participates in energy recovery throughout the entire braking process. The total recycled energy ( $E_{sum 1}$ ) is the sum of the deformation energy of the coil spring and the feedback energy to the power battery.

What is electro-mechanical braking energy recovery system?

An electro-mechanical braking energy recovery system is presented. Coil springs are used for harvesting the braking energy of a vehicle. The system can provide extra start-up torque for the vehicle. Efficiencies of 0.56 and 0.53 are obtained in the simulation and experiments.

How to recover brake braking energy efficiently?

Some advanced technologies like “serial 2 control strategy”, centralized storage system, and regenerative downshift have been proven to recover brake braking energy efficiently. Because of dense traffic lights in cities, vehicles brake and start up frequently, which results in considerable energy consumption.

How intelligent energy management system should detect braking demand?

Therefore, the intelligent energy management system should detect the braking demand to decide whether the vehicle is in the emergency braking, deceleration braking or parking braking state and to select the braking plan accordingly. Fig. 4. (a). Configuration of the case study electric vehicle with regenerative brake. (b).

How do electric braking systems work?

Based on this, the power of the motor can be obtained by combining the electric braking torque, and the braking intensity can be calculated based on

the vehicle speed. The energy management system then derives the optimal electric braking torque based on the braking intensity and sends it to the braking controller.

How does regenerative braking work?

The regenerative braking system converts the kinetic energy of driving vehicles into elastic potential energy. This process can be modelled and simulated to identify the characteristics of the proposed regenerative braking system. Ignore the influence of wind resistance and heat dissipation on the energy collection efficiency of the system.
