# Can forage grass be cleared and stored directly

## Overview

---

An ideal crop to be ensiled should have an adequate level of sugars (measured as water-soluble carbohydrates, WSC) to be fermented, low buffering capacity (that is, resistance to changes in pH), and a stand with.

When is the best time to conserve grass?

Grasses, as well as a range of other forages, are usually conserved during periods of peak growth in late spring, summer and early autumn in order to create a stored product that can be fed during periods of reduced grass growth.

When should you use conserved forage?

Traditionally, this has almost exclusively been during the cold and wet late autumn, winter and early spring months but, increasingly, conserved forage is also being used to supplement grazed grass during prolonged cold, wet or, particularly, dry spells at other times of the year.

Is forage grass harvested too dry or too wet?

In Denmark, it is assessed that one-third of forage grass on farms is harvested too dry and that another third is harvested too wet when compared with the optimal moisture content in terms of quality (Danish Advisory Centre 2001).

How to produce quality forage?

Introduction The production of quality forage requires a close monitoring of the crop conditions for optimized handling efforts (Foulds and Wilson 2005, Sørensen and Bochtis 2010). The grass must be cut, raked, and collected at the right time in order to achieve maximum digestibility (Kuoppala et al. 2008).

What is grass silage?

Therefore, most of the information in this section concerns the making of grass silage. Silage is the product formed when a crop (grass or other materials e.g., legumes, cereals, brassicas) containing sufficient moisture to

spoil as a result of the activity of aerobic organisms is stored anaerobically.

How do you choose a forage conservation technique?

The choice of forage conservation technique employed on farm is largely determined by practicalities such as location (especially rainfall), the scale of operation, the availability of machinery or contractors and the storage facilities available on farm as well as the feeding system employed and the needs of the animals.
