Classification table of air energy storage types

Overview

How are energy storage systems classified?

The most common methods for classification of ESSs are based on energy usage in a specific form, including electrical energy storage (EES) and thermal energy storage (TES), or based on the types of energy stored in the system (kinetic or potential; thermal, electrical, mechanical, chemical, etc.) [11, 18, 23].

What are the different types of energy storage?

Note that other categorizations of energy storage types have also been used such as electrical energy storage vs thermal energy storage, and chemical vs mechanical energy storage types, including pumped hydro, flywheel and compressed air energy storage. Fig. 10. A classification of energy storage types. 3. Applications of energy storage.

What are the different types of chemical energy storage systems?

The most common chemical energy storage systems include hydrogen, synthetic natural gas, and solar fuel storage. Hydrogen fuel energy is a clean and abundant renewable fuel that is safe to use. The hydrogen energy can be produced from electrolysis or sunlight through photocatalytic water splitting (16,17).

How many types of thermal energy storage systems are there?

It was classified into three types, such as sensible heat, latent heat and thermochemical heat storage system (absorption and adsorption system) (65). (Figure 14) shows the schematic representation of each thermal energy storage systems (66). Figure 14. Schematic representation of types of thermal energy storage system. Adapted from reference (66).

What are the most cost-efficient energy storage systems?

Zakeri and Syri also report that the most cost-efficient energy storage

systems are pumped hydro and compressed air energy systems for bulk energy storage, and flywheels for power quality and frequency regulation applications.

What is compressed air energy storage?

Compressed air energy storage In compressed air energy storage (CAES) systems, air is compressed and stored in an underground cavern or an abandoned mine when excess energy is available. Upon energy demand, this pressurized air can be released to a turbine to generate electricity.
