DC micro grids are becoming more and more common because of their simple integration with renewable energy sources and the growth of loads that are compatible with DC power. DC micro networks are very vulnerable to variations in power supply due to the high concentration of renewable energy sources.

DC micro grids are becoming more and more common because of their simple integration with renewable energy sources and the growth of loads that are compatible with DC power. DC micro networks are very vulnerable to variations in power supply due to the high concentration of renewable energy sources.

This is an effective solution to integrate a hybrid energy storage system (HESS) and renewable energy sources to improve the stability and reliability of the DC microgrid and minimize power losses. As a power density-based energy storage device, the SC (supercapacitor) can provide rapid power.

Based on the analysis of the energy storage requirements for the stable operation of the DC microgrid, battery-supercapacitor cascade approach is adopted to form hybrid energy storage system, in a single hybrid energy storage subsystem for battery and supercapacitor and in the microgrid system of.
