Energy storage battery distribution system control

Overview

In this paper, the battery energy storage (BES) systems are used in order to solve the voltage rise during the peak PV generation as well as the voltage drop while meeting the peak load. A coordinated control strategy is proposed to regulate the charge/discharge of BESs using a combination of the.

Abstract—This paper proposes a decision-making approach for the control of distribution systems with distributed energy resources (DERs) equipped with photovoltaic (PV) units and battery energy storage systems (BESS). The objective is to minimize the total operational cost of the distribution.

This paper describes a control framework that enables distributed battery energy storage systems (BESS) connected to distribution networks (DNs) to track voltage setpoints requested by the transmission system operator (TSO) at specific interconnection points in an optimal and coordinated manner. Can a distributed control strategy support frequency regulation in power systems?

In this paper a distributed control strategy for coordinating multiple battery energy storage systems to support frequency regulation in power systems with high penetration of renewable generation is proposed.

Can a distributed control scheme provide real-time voltage regulation?

Conclusion A distributed control scheme is developed for coordinating distributed BESS in DN to provide real-time voltage regulation and satisfy the required voltage profiles specified by TSOs. An optimisation problem is formulated to schedule the operation of the BESS inverters for an efficient and real-time delivery of voltage support.

Can a Droop controller control energy storage devices?

As illustrated in Sanz et al. (2018), the current practice to control energy storage devices, including BESS, is to use a droop-based controller. However, this decentralised approach fails to regulate the voltage to the desired setpoint since it is basically a proportional controller.

What is a distributed approach to accelerated voltage regulation?

Authors in Liu et al. (2017) propose a distributed approach that coordinates DERs to regulate voltage profiles, whilst in Tang et al. (2018) a distributed approach to the accelerated voltage regulation, which requires the same R / X ratio, is developed.

Which objective functions are used in distributed voltage regulation problems?

Most of the objective functions used in distributed voltage regulation problems, including the one defined in the Problem 2.2, can easily satisfy these assumptions, e.g., network loss minimisation (Li et al., 2019), and voltage control (Zeraati et al., 2016, Zhu and Liu, 2015).

Can no voltage control be regulated at all nodes of the DN?

It can be seen that both the benchmark case of no voltage control and the decentralised approach are not able to regulate the voltages at all nodes of the DN within acceptable ranges, especially during periods of high PV power generation, as shown in Fig. 7 and Fig. 8.
