What is a distribution network planning problem?

First and primary planning problem in the distribution network is the network upgrade and/or expansion planning which refers to define the location and capacity of the new added or upgraded lines to cope with load growth and network congestion considering minimum investment cost.

How to plan ESS in a distribution network?

Abovementioned applications can be achieved, quantified, and calculated by steady-state balanced studies. These applications are considered as a goal to plan ESSs in the distribution networks by network operation frameworks namely optimal power flow (OPF) and unit commitment (UC).

Which storage technologies are suitable for employment in distribution networks?

In contrast, with the advancement of the high power and high energy density, high efficiency, environmental friendly and grid scale batteries, these devices are becoming one of the most potential storage technologies suitable for employment in the distribution networks.
