Can a battery energy storage system be used in a low voltage distribution network?

Abstract: In this paper, using of a battery energy storage system in a low voltage distribution network for improving the integration of distributed generation and island operation during the failure in the main grid is presented. Modeling and simulation of the low voltage distribution network are performed using DigSilent Power Factory.

What is a voltage control strategy involving distributed energy storage?

A voltage control strategy, involving distributed energy storage, is proposed in order to solve the voltage deviation problem caused by the high proportion of PV connected to the low voltage distribution network (LVDN). A voltage calculation method of the LVDN node with a high proportion of PV is proposed.

How do low-voltage distribution networks control voltage?

As explored by the authors of [1], according to the high R/X ratio of the low-voltage distribution network, the voltage is controlled by controlling the output power of photovoltaic power generation in the overvoltage period, but the active power of photovoltaic power generation output is reduced.

How LVdn voltage is adjusted in a distributed energy storage system?

By controlling the injected power of the distributed energy storage, the LVDN voltage is adjusted, which is more conducive to dealing with the voltage exceeding the limit caused by the imbalance of the internal load in the partitions.

How is a low voltage distribution network modeled?

Modeling and simulation of the low voltage distribution network are performed using DigSilent Power Factory. The observed network consists of households whose load diagram based on measurement data is modeled. Distributed generation in the observed network is a photovoltaic power plant.

Why does a low-voltage distribution network have a high proportion of PV?

In the low-voltage distribution network with a high proportion of PV, the voltage of the distribution network nodes increases, and some nodes exceed the limit during the photovoltaic output period, because the PV output is not synchronized with the load demand.
