As America moves toward energy independence, energy storage solutions play a critical role in strengthening our grid and ensuring a reliable power supply. For landowners, leasing property for energy storage offers a unique chance to boost local economies, support our nation's energy security, and.

The mandatory co-location of energy storage at new energy power plants was terminated, and independent energy storage also lost its major source of profit – capacity leasing revenue. Currently, the profit paths for independent energy storage power stations in China mainly include price arbitrage. Is energy storage a permanent solution?

Despite the uncertainty of future economics, the trend is clear: energy storage is here to stay. The high capital expenditure, long storage system lifespans, and uncertain policy changes make costs uncertain, but the still-falling costs and exponential increase in capacity demonstrate this.

Can low-cost long-duration energy storage make a big impact?

Researchers find that innovative, low-cost long-duration energy storage, when combined with specific parameters, can potentially make a large impact in a more affordable and reliable energy transition.

Is the energy storage mandate a big change?

This is a big change towards rationalization of renewables but hidden within that is a removal of the energy storage mandate," George Hilton, research and analysis manager at S&P Global, tells ESS News. S&P Global estimates that the storage mandate has driven between 50 and 75% of domestic demand.

How will the energy storage mandate impact China?

S&P Global estimates that the storage mandate has driven between 50 and 75% of domestic demand. With China accounting for around 56% of the global energy storage demand in 2024, the impact of such a policy change will be massive.

How will a new battery energy supply chain affect prices?

S&P Global expects the move to reverberate throughout the global battery energy storage supply chain, further driving down prices that are already at historically low levels. New renewable energy plants in China will no longer be required to build storage in order to secure development rights and grid connection.

How will China's energy storage policy affect global demand?

“China was on-track to install over 60% of all utility scale storage globally in 2025 and so in the absence of further policy changes, about 45% of global demand has just been wiped away,” Hilton says. The ripple effect on the global demand-supply balance will involve further downward pressure on energy storage prices.
