power grid can assist the power system in peak shaving. Therefore, this paper establishes an energy storage peak shaving model considering carbon footprint cost and establishes a user-side carbon footprint cost model. On storage to provide peak capacity in the U.S. power grid. We identify the.

Providing peaking capacity could be a significant U.S. market for energy storage. Of particular focus are batteries with 4-hour duration due to rules in several regions along with these batteries' potential to achieve life-cycle cost parity with combustion turbines compared to longer-duration.
