Develop cost-effective multi-functional packaged heat pump for multi-family buildings, having a IEER > 17.0; HSPF > 10.0 and annual water heating COP > 4.0, 100% heating capacity and COP > 2.0 down to 5°F. E3 initiative challenges HPWH and CCHP. Majority of multi-family buildings still use.

Heat pump integrated thermal energy storage is analyzed for demand response in grid-interactive buildings. We have reviewed various configurations presented in the literature, in both active and passive storage, and analyzed the reported demand impact, energy savings, and cost savings. Buildings.

Recent research has shown that electric building climate control systems like heat pumps can provide this demand flexibility by effectively storing energy as heat in the thermal mass of the building. While some forms of heat pump demand flexibility have been implemented in the form of peak pricing.
