# How to store energy with shunt trip

## Overview

---

What is a shunt trip device?

A shunt trip device is an optional accessory in a circuit breaker that mechanically trips the breaker when power is applied to the shunt trip terminals. The power for the shunt trip does not come from within the breaker, so it must be supplied from an external source.

Does a shunt trip need a circuit breaker?

The power for the shunt trip does not come from within the breaker, so it must be supplied from an external source. Some circuit breakers allow field installation of a shunt trip kit, however others require factory installation when the breaker is ordered.

How does a shunt trip breaker work?

Normally the current passes through the circuit breaker. But if these currents become high surges, the larger surge of power changes the electromagnet below the breaker switch, tripping the cutting power and switch. The shunt trip breaker offers extra techniques to charge the electromagnet and trip switch, helping remote or automatic power shutoff.

What are the different types of shunt trip breaker?

There are 2 main types of shunt trip breakers: the first is manual, and the second is automatic. Manual switches help to off the breaker externally with the use of the remote button. Automatically switch off power when detecting surges from the external power supply. How Does a Shunt Trip Breaker Work?

.

How do I trigger a shunt trip breaker remotely?

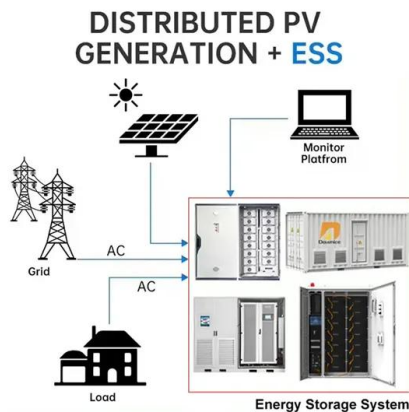

Another option to consider is the use of a shunt trip relay, which can be used to trigger a shunt trip breaker remotely. These relays are typically connected

to fire alarm systems or other emergency management systems and can send a signal to the breaker to trip it when an emergency occurs.

What is the difference between GFCI and shunt trip breaker?

You should know that shunt trip breakers are different from GFCI circuit breakers. The GFCI circuit breaker contains one big white tail wire for neutral connections only. It cannot be connected to any control package because the GFCI circuit breaker is solely designed to detect a sudden electrical surge.
