regulation of power system has been greatly challenged. The application of energy storage unit is a measure to reduce energy storage system (BESS) w power grid can assist the power system in peak shaving. Therefore, this paper establishes an energy storage peak shaving model considering carbon.

to analyze the co-optimization of batteries for both energy arbitrage and regulation services [13], [14]. In this paper, we consider the joint optimization o using a battery storage system for both peak shaving and frequency regulation for a commercial customer. Peak shaving can be used to reduce. Can a battery storage system be used for peak shaving?

using a battery storage system for both peak shaving and frequency regulation for a commercial customer. Peak shaving can be used to reduce the peak demand charge for these customers and the (fast) frequency.

What is the power and capacity of Es peaking demand?

Taking the 49.5% RE penetration system as an example, the power and

capacity of the ES peaking demand at a 90% confidence level are 1358 MW and 4122 MWh, respectively, while the power and capacity of the ES frequency regulation demand are 478 MW and 47 MWh, respectively.

Does es capacity enhance peak shaving and frequency regulation capacity?

However, the demand for ES capacity to enhance the peak shaving and frequency regulation capability of power systems with high penetration of RE has not been clarified at present. In this context, this study provides an approach to analyzing the ES demand capacity for peak shaving and frequency regulation.

Do flexible resources support multi-timescale regulation of power systems?

Here, we focused on this subject while conducting our research. The multi-timescale regulation capability of the power system (peak and frequency regulation, etc.) is supported by flexible resources, whose capacity requirements depend on renewable energy sources and load power uncertainty characteristics.
