Inner hole of energy storage water cooling tube

Overview

How does a water-cooling system work?

To remove the heat load from the synchrotron light and to decrease the thermal desorption of the vacuum chambers, a water-cooling system is designed that provides deionized water (DIW) at 25 °C for the vacuum chambers (Al system) and absorbers (Cu system) at pressure 7.5 kg/cm².

Where can thermal energy storage be found?

Thermal Energy Storage (TES) for chilled water systems can be found in commercial buildings, industrial facilities and in central energy plants that typically serve multiple buildings such as college campuses or medical centers (Fig 1 below).

How to monitor a cooling system in one bending cell?

Figure 9: 3D drawing of a cooling system in one bending cell. To monitor the status of cooling system is necessary. More than 30 PT-100 temperature sensors in a 1/24 section are installed in the cooling loops and the vacuum equipment to ensure that each works well. The readings of the rate of flow of cooling water are monitored and recorded.

What is the flow speed of a cooling tube?

A cooling tube (diameter 16 mm) of a S-chamber has a flow of speed ~0.8 m/s, but 1.44 m/s for the tube (12.6 mm) of the B-chamber. To maintain a flow speed < 2 m/s is important to decrease corrosion that occurs in welded joints of aluminium cooling pipes and the chamber. Figure 7: Manifolds under a girder.
