LAES involves converting electricity into liquid air – cleaning, cooling and compressing air until it liquefies – to be stored for later use. To discharge the energy, the air is heated and re-expanded, driving turbines connected to generators to produce electricity. While many of its qualities are.

LAES involves converting electricity into liquid air – cleaning, cooling and compressing air until it liquefies – to be stored for later use. To discharge the energy, the air is heated and re-expanded, driving turbines connected to generators to produce electricity. While many of its qualities are.

Liquid Air Energy Storage (LAES) technology uses a freely available resource - air - cooled and stored as a liquid. When energy is needed, the liquified air is converted back into a pressurized gas which drives turbines to produce electricity. LAES is ideal for replacing fossil fuel-based power.

Liquid air energy storage technology utilizes readily available air, cooling it into a liquid form for storage and later converting it back to a pressurized gas to drive turbines and generate electricity. We at Sumitomo SHI FW provide Liquid Air Energy Storage (LAES) solutions utilizing a.
