location method based on the standard deviation of network loss sensitivity is proposed.

What is a two-layer optimal allocation method for distribution network transformer overload?

Conclusion This paper aims at the problem of distribution network transformer overload operation caused by small output of DG, a two-layer optimal allocation method for DES and transformer capacity is proposed. The method coordinates the configuration of DES and transformer capacity.

Why does des discharge during the period of transformer overload?

In order to prevent transformer overload, DES discharges during the period of transformer overload to reduce the peak load of the distribution network, so as to reduce the load ratio of the transformer, so as to delay the upgrade and expansion of the existing transformer.

Can distributed energy storage solve the problems of uneven distribution?

Literature [1], [2], proposed that distributed energy storage with its characteristics of flexible throughput power and fast response to energy, can effectively solve the problems of uneven distribution of DG in space and time and insufficient absorption capacity of distribution network.

How to solve the problem of transformer overload?

In order to solve the problem of transformer overload, it is usually adopted to expand the capacity of transformer directly, but the limitation of this method is that the expansion part is only used at the moment of transformer overload and the investment cost of expansion is high [3], [4].
