Inductors can convert electrical energy into magnetic energy and store it in the magnetic field generated by the coil. This conversion process is based on Faraday's law of electromagnetic induction, which states that when current flows through an inductor, it generates a magnetic field around it.

When a current passes through an inductor, it creates a magnetic field, storing energy proportional to the intensity of the current and the inductance. This stored energy can later be released back into the circuit when the current decreases, facilitating energy management. Furthermore.
