The market for phase change materials may be broken down according to type (organic, inorganic), as well as application (HVAC, cold chain & packaging, textile, electronics, thermal energy storage, refrigeration & equipment, and others).

What are phase change materials?

Phase change materials are products that store, release, and absorb heat as they oscillate between liquid and solid forms. They are also known as latent heat storage materials as they can store large amounts of thermal energy as latent heat during phase transition.

Which materials store energy based on a phase change?

Materials with phase changes effectively store energy. Solar energy is used for air-conditioning and cooking, among other things. Latent energy storage is dependent on the storage medium's phase transition. Acetate of metal or nonmetal, melting point 150-500°C, is used as a storage medium.

What are phase change energy storage materials (pcesm)?

1. Introduction Phase change energy storage materials (PCESM) refer to compounds capable of efficiently storing and releasing a substantial quantity of thermal energy during the phase transition process.

What are phase change materials (PCMs)?

Phase change materials (PCMs) are substances that, absorb or release substantial amounts of heat that is referred to as "latent" heat. These materials are classified as "phase change materials."

Does Germany have a significant market share in phase change materials?

Germany, as the top manufacturer and exporter of phase change materials, is making a substantial contribution to market growth, allowing Europe to

maintain its dominance in the phase change materials industry. As a result, in the future years, the company hopes to achieve a significant market share in phase transition materials.
