Mist storage device can disinfect

Overview

What is a disinfectant misting system?

A disinfectant misting system is a type of installation that can be put in place in any area, large or small. It consists of a stainless-steel line system along with extenders and circulation fans (sometimes even misting fans), depending on the surface being disinfected.

How to install an atomized misting system?

To install an atomized misting system for cleaning and disinfecting, you need to consider specific measurements such as the size of the nozzle and the height of installation. It also involves scientifically combining the air aspiration of the fans with the distribution of the cleaner and finding the right combination of disinfectant and water.

How does an electrostatic misting system work?

An electrostatic misting system sprays disinfectant directly on surfaces in the form of a mist and gives it an electric charge as it leaves the sprayer. This results in immediate coverage of the surface below.

What are the advantages of an atomized misting system?

An atomized misting system offers the advantage of automating the sanitizing process in any facility, such as a building or a boat, by setting up controls in different zones based on specific criteria.

How does the bioster intensive disinfection system work?

The BIoSTER intensive disinfection system performs its operations when the dentist has completed his task. It carries out automatic cycles of disinfection of the spray . FOR THE OPERATORS (operator-free). - AUTOMATED system; just set the volume of the rooms to be treated and the ml / m3 concentration of the disinfectant used.

What is a HDM[®] disinfection system?

Thanks to its portability and ease of use, the HDM[®] system is one of the most versatile automated room disinfection solutions available on the market, used across multiple healthcare environments and specialities for preventative and outbreak situations.
