Mountain gravity energy storage

Overview

The world is undergoing an energy transition with the inclusion of intermittent sources of energy in the grid. These variable renewable energy sources require energy storage solutions to be integrated smoothly over.

What is mountain gravity based energy storage?

A new energy storage solution based on mountain gravity is found particularly for grids smaller than 20 MW. MGES is a solution for seasonal storage where there is no water for pumped-storage solutions. We show the world potential for MGES using a GIS based tool.

Is mountain gravitation energy storage a viable alternative to long-term energy storage?

Conclusion This paper concludes that mountain gravitation energy storage could be a viable alternative to long-term energy storage, particularly, in isolated micro-grids or small islands demanding storage capacities lower than 20 MW.

Why is MGES a good choice for energy storage?

As it can be seen the MGES plant operation focuses on storing energy for the long-term and the batteries are used to store energy for the short-term. This is convenient because the installed capacity of MGES (short-term storage) is high, however the costs for long-term energy storage is low.

How much does it cost to store energy with MGES?

This paper shows that the cost of storing energy with MGES will vary between 1 and 2 million \$/MW of installed capacity and levelized cost of 50–100 \$/MWh. The higher the height difference between the lower and upper storage sites, the lower the cost of the project.

How long does energy storage last in a MGES plant?

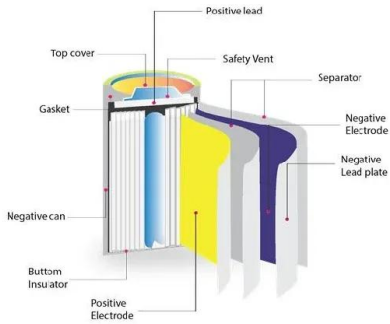

As Table 2 depicts, different operational arrangements could result in energy storage cycles of a day, weeks or years. The MGES plant design and operation

should focus on long-term storage cycles (monthly, yearly, seasonal) as batteries can provide short-term energy storage more reliably, cheaply and efficiently.

Does gravity energy storage system occupy a dominant position with vanadium redox batter?

Based on the characteristics of gravity energy storage system, the paper presents a time division and piece wise control strategy, in which, gravity energy storage system occupies a dominant position supplemented by vanadium redox batter.
