**Abstract:** This paper studies the optimal control strategies of hybrid renewable energy systems, focusing on offshore wind farms with energy storage systems (ESS), considering challenges of economic costs, operational reliability, and environmental impacts. Wind energy is widely exploited as a. Why do offshore wind power stations need energy storage?

The lack of peak regulation capacity of the power grid leads to abandoned wind. The installation of an energy storage system is flexible, and the configuration of energy storage for an offshore wind power station can promote it to become a high-quality power supply.

What is the best energy storage configuration scheme for offshore wind farms?

According to this method, the best energy storage configuration scheme is (0.3, 1). It means that the scale of the lithium-ion battery energy storage system configured for the offshore wind farm with a total installed capacity of 9176.5 MW in the coastal area is 2752.95 MW/2752.95 MWh.

Can energy storage technologies be used in an offshore wind farm?

Aiming to offer a comprehensive representation of the existing literature, a multidimensional systematic analysis is presented to explore the technical feasibility of delivering diverse services utilizing distinct energy storage technologies situated at various locations within an HVDC-connected offshore

wind farm.

How does the abandoned wind rate of offshore wind power affect energy storage?

Thus, with the further increase in new energy storage power capacity and energy capacity, the abandoned wind rate of offshore wind power gradually decreases. Table 5. Relationship between the abandoned wind rate of offshore wind power and the energy storage configuration scheme in this region.

How much does offshore wind power storage cost?

Based on the power supply and line structure of the power grid in a coastal area, an example analysis of offshore wind power storage planning was conducted. According to this method, the best energy storage configuration scheme was (0.3, 1), at an annual cost of 75.978 billion yuan.

Can offshore wind power generation be combined with underwater compressed air energy storage?

A physical model combining offshore wind power generation with an underwater compressed air energy storage system was established in [ 25 ]. In [ 26 ], an optimal energy storage allocation model was constructed based on the improved scene clustering algorithm under the application scenario of smoothing the offshore wind power output fluctuation.
