# Phosphor energy storage principle

## Overview

---

Can phosphorus be used in energy storage?

Phosphorus in energy storage has received widespread attention in recent years. Both the high specific capacity and ion mobility of phosphorus may lead to a breakthrough in energy storage materials. Black phosphorus, an allotrope of phosphorus, has a sheet-like structure similar to graphite.

What is a storage phosphor?

A storage phosphor is a material that stores a significant part of the energy released on interaction with radiation in long-living traps. In principle, it is similar to an inorganic scintillator, but the trap, which acts as the loss mechanism in a scintillator (Figure 3), functions as the memory bit in a storage phosphor.

Can black phosphorus be used in energy storage?

In this review, we outline recent research on the application of black phosphorus in energy storage. By the summary of several early reviews and the collation of related research fields, the important research progress of phosphorus, especially black phosphorus, in the field of electrochemistry is introduced.

Are phosphorus-based mesoporous materials suitable for energy storage and conversion?

In this article, we highlight recent advancements in the synthesis of phosphorus-based mesoporous materials for energy storage and conversion, including metal phosphates, phosphonates, and phosphides. The discussion is sectioned into three parts according to different synthetic approaches (i.e., soft-template, hard-template, and template-free).

How does PSP Store X-ray energy?

A Phosphor Storage Panel (PSP) stores absorbed X-ray energy in the crystal

structure, known as 'traps'. This trapped energy can be released if stimulated by light of the proper wavelength by the process of photostimulated luminescence (PSL). The PSP is sometimes referred to as a storage phosphor.

What is a photostimulable phosphor material?

It is referred to as a photostimulable phosphor material. The most common type is barium fluorohalide doped with europium (BaFX:Eu), where the halide (X) is a combination of bromide and iodide, typically 85% and 15% respectively.
