# Photochemical energy storage

## Overview

Placeholder text for the first paragraph.

Solar-to-electrochemical energy storage in solar batteries is an important solar utilization technology alongside solar-to-electricity (solar cell) and solar-to-fuel (photocatalysis cell) conversion. Integrated solar batteries that integrate photoelectrodes with redox-electrodes realize indirect.

This chapter highlights energy storage strategies that utilise solar energy to drive the formation of chemicals, fuels and feedstocks. The production of solar fuels that can be stored and transported is an attractive way to address the intermittency of terrestrial solar energy and provide.

Using natural photosynthesis as a working model for solar energy use, scientists are designing and preparing chemical systems capable of capturing and storing solar energy. Nowadays, different alternatives to make use of sunlight are under research, including direct use of photonic solar power and.
