Pilot pump energy storage tank

Overview

Storing energy offshore by means of hollow concrete spheres placed at the bottom of the sea is a very attractive solution to combine technical features of conventional pumped hydro storage systems with a hu.

What is a pumped hydro energy storage system?

Well-established large-scale storage systems are pumped hydro energy storage systems (PHES) having rated powers ranging from several ten MW to several GW. At present, almost 99% of the global storage capacity is realised by PHES. In 2030, IRENA expects a market share of 325 GW for PHES and 150 GW for battery technologies .

Do pumped hydro storage systems need ventilation?

Test operation has confirmed that ventilation is not required. Storing energy offshore by means of hollow concrete spheres placed at the bottom of the sea is a very attractive solution to combine technical features of conventional pumped hydro storage systems with a huge resource potential around the globe in an economic way.

What is the difference between PTEs and pumped hydro storage?

Compared with the established energy storage technologies, compressed air energy storage (CAES) and, in particular, pumped hydro storage (PHS), the PTES configurations of this study are characterised by a smaller installation footprint and no requirement for specific geographical constraints that significantly limit their use.

What piping is used in a pilot plant?

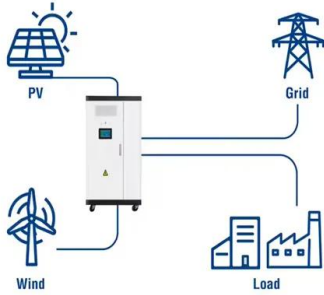

The piping of the pilot plant facility is divided into two different loops: the HTF loop and the molten salts loop (Fig. 2 b). The HTF loop consists of a stainless steel 316 L piping of 1" of diameter. With the implementation of different by-passes, different flow arrangements (parallel and counter flow) can be achieved in the heat exchange system.

What is a storage tank and a technical unit?

One is a hollow concrete sphere representing the storage tank and the other is the cylindrical technical unit holding the pump turbine, a controllable valve and the components of the Supervisory Control and Data Acquisition (SCADA) system. The technical unit is removable and can be recovered separately, which facilitates maintenance and repairs.
