Portable mobile energy storage power supply caught fire

Overview

Are mobile energy storage systems ready for a 2023 New Year's Day fire?

Mobile energy storage systems are being deployed in jurisdictions around the world, and—as demonstrated by a 2023 New Year's Day mobile energy storage system fire —accidents can happen. We want to make sure communities are prepared for when these systems are deployed in their backyard.

What is a mobile energy storage system?

An energy storage system contains a large amount of energy stored in a small space, which may make it the target for those who look to cause harm. For this reason, a deployed mobile energy storage system is required to be provided with a fence with a locked gate that keeps the public at least 5 ft (1.5 m) away from the ESS.

Can a portable charger cause a fire?

Improper Use and Storage Storing a portable charger in high heat or humid conditions can damage its battery cell, just as improper practices like prolonged charging or using incompatible chargers can. These stresses on the battery may cause overheating and increase the risk of fire.

Can you buy a portable power source?

The ubiquitous portable power source, which can be bought for as little as \$9, has come under scrutiny in recent months, following fires involving such devices. One such fire destroyed an Air Busan plane on the tarmac in South Korea in January, after which a number of airlines banned passengers from using power banks on planes.

Can a power bank catch fire?

Power banks can catch fire whether you're using them or not. While they're generally safe, there are some situations where they can pose a greater risk.

Overcharging occurs when a power bank is left plugged in after it is fully charged. This can lead to overheating and, in extreme cases, a fire.

How far can a mobile energy storage system be deployed?

Additional limitations for where a mobile energy storage system can be deployed include a 10 ft (3 m) limitation on how close it can be to various exposures and a 50 ft (15.3 m) limitation on how close it can be to specific structures with an occupant load of 30 or greater.
