# Proxy mode energy storage

## Overview

---

What are the cash flows of proxy storage PPAs?

From the energy buyer perspective, the cash flows of proxy storage PPAs are based on the revenues of the optimal operation of a virtual energy storage technology (with predefined characteristics) on the day-ahead market.

Are proxy storage PPAs the future of battery storage?

Such threshold prices overlap with the best-case forecast of the battery levelized cost of storage in 2030, indicating that proxy storage PPAs can play a role in enabling battery storage installations within the next ten years in Europe (generating about €180 million per year).

What is a proxy storage power purchase agreement (PPA)?

We propose a contractual setup, the proxy storage power purchase agreement (PPA), to foster the deployment of energy storage technologies. We define a threshold price below which the PPA becomes financially attractive for PPA buyers. We compute the threshold price for several storage technologies and configurations, in seven European countries.

Can proxy storage PPAs Foster unsubsidized energy storage installations in Europe?

While arbitrage revenues could only cover a fraction of the costs of energy storage in past years, we show that proxy storage PPAs have the potential to foster unsubsidized energy storage installations in Europe within the next decade, especially when the storage is charged from the electricity grid or from co-located wind energy generation assets.

When are proxy storage PPAs attractive?

From the perspective of the project developer, proxy storage PPAs are attractive when the total revenues of the storage project—typically day-ahead market arbitrage, day-ahead, intraday and ancillary service markets—exceed

the total cost of the storage.

Do proxy storage PPAs make money?

Conversely, in the high electricity price scenarios, proxy storage PPAs create positive net revenues across all considered countries, for a total of € 180 million per year for grid-charged energy storage. In these conditions, project developers can offer proxy storage PPAs and buyers can make profits.
