# Report on the current status of wind energy storage

## Overview

---

At the beginning of 2020, wind power capacity worldwide exceeded approximately 650 GW, covering less than 5% of the global electricity demand. This current global wind power capacity is enough to power more than 400 million average houses. The International Renewable Energy Agency projects that.

HOUSTON/WASHINGTON, D.C., March 19, 2025 — The U.S. energy storage market set a new record in 2024 with 12.3 gigawatts (GW) of installations across all segments, according to the latest U.S. Energy Storage Monitor report released today by the American Clean Power Association (ACP) and Wood.

The following resources provide information on a broad range of storage technologies.

The backlog of new power generation and energy storage seeking transmission connections across the U.S. grew again in 2023, with nearly 2,600 gigawatts (GW) of generation and storage capacity now actively seeking grid interconnection, according to new research from Lawrence Berkeley National. Can energy storage improve wind power integration?

Overall, the deployment of energy storage systems represents a promising solution to enhance wind power integration in modern power systems and drive the transition towards a more sustainable and resilient energy landscape. 4. Regulations and incentives This century's top concern now is global warming.

What is the global wind report 2025?

3 As we enter a new era in renewable energy, the Global Wind Report 2025 serves as a beacon of hope and a call to action for the global community. The journey of wind energy has been nothing short of remarkable, evolving from a niche technology to a mainstream source of power that is now integral to our energy transition efforts.

Can energy storage control wind power & energy storage?

As of recently, there is not much research done on how to configure energy storage capacity and control wind power and energy storage to help with frequency regulation. Energy storage, like wind turbines, has the potential to regulate system frequency via extra differential droop control.

Can energy storage systems reduce wind power ramp occurrences and frequency deviation?

Rapid response times enable ESS systems to quickly inject huge amounts of power into the network, serving as a kind of virtual inertia [74, 75]. The paper presents a control technique, supported by simulation findings, for energy storage systems to reduce wind power ramp occurrences and frequency deviation .

Why is energy storage used in wind power plants?

Different ESS features [81, 133, 134, 138]. Energy storage has been utilized in wind power plants because of its quick power response times and large energy reserves, which facilitate wind turbines to control system frequency .

Who is responsible for battery energy storage services associated with wind power generation?

The wind power generation operators, the power system operators, and the electricity customer are three different parties to whom the battery energy storage services associated with wind power generation can be analyzed and classified. The real-world applications are shown in Table 6. Table 6.
