Shared energy storage investment price

Overview

In this paper, an energy trading framework is proposed for shared energy storage provider (SESP) and multi-type consumers aiming at improving utilization efficiency of SESS and the benefits of all participants. The opinions of this paper are twofold as listed: 1) An energy trading framework is.

The capacity-leasing model of shared energy storage (SES) has become a key method for flexibly configuring energy storage, gaining popularity among new energy stations, prosumers, and other stakeholders. However, setting an appropriate price is critical to the development and adoption of SES.

Imagine trying to buy a smartphone that costs \$200 in California but suddenly jumps to \$500 in Texas – that's essentially today's shared energy storage price landscape. From Inner Mongolia's 1.375\$/Wh projects to Yunnan's jaw-dropping 0.727\$/Wh bids [1] [2], the numbers are as varied as China's.

The paper considers two methods for energy storage, constructs a pricing model using dynamic game theory, derives the optimal strategy, identifies and quantifies pricing risks. A regional market simulation proves the model's effectiveness, providing support for SES pricing and risk prevention.

Based on the definition and classification of business models, it analyzes shared energy storage from three dimensions: pricing mechanism, investment model, and profit model. Firstly, it analyzes some policies related to shared energy storage at the national level in China and in various provinces. How a shared energy storage system works?

A two-stage model describing the storage sharing among stakeholders is developed. Storage sharing contribution rate is defined to inspire stakeholders to join share. An incentive mechanism is designed based on the asymmetric Nash bargaining model. Shared energy storage system ensures the economic

feasibility of all participants.

What is shared Energy Storage (SES)?

The consumption of renewable energy is driving the development of energy storage technology. Shared energy storage (SES) is proposed to solve the problem of low.

Are shared energy storage rates correlated with shared charging/discharging power?

In the shared energy storage mechanism proposed in this paper, the contribution rates of all prosumers are positively correlated with their shared charging/discharging power, that is, the greater the shared charging/discharging power, the more the cost-saving of prosumers.

Does a shared storage system have a complementarity of power generation and consumption?

In this context, considering the complementarity of power generation and consumption behavior among different prosumers, this paper proposes an energy storage sharing framework towards a community, to analyze the investment behavior for shared storage system at the design phase and energy interaction among participants at the operation phase.

Does a storage sharing mechanism save money?

Numerical results show that, compared with personal energy storage scenario, the proposed storage sharing mechanism can achieve 6.09% cost savings, the self-consumption rate and self-sufficiency rate of renewable energy respectively increase by 5.01% and 5.21%, and all financial evaluation indexes have improved.

How does storage sharing work?

Under the storage sharing mode in which users invest in storage equipment individually and share their idle storage capacities within the community, the optimal energy storage size is determined by the genetic algorithm. However, the energy trading process is fixed, which may reduce users' cost savings.
