Suspension energy storage function

Overview

What is suspension energy?

The suspension energy, in this paper, refers to the reciprocating vibration energy of the vehicle suspension system, which is mainly caused by the uneven road surface. Although it is caused by the road roughness excitation, its ultimate source is also from the vehicle powertrain, which is a part of the total engine/motor output energy.

How much energy does a vehicle suspension system recover?

Some researchers carried out preliminary studies on vehicle suspension energy recovery potential , , , , but there is a significant difference in the specific amount of energy recovery, various from 46 W to 7500 W in a full vehicle suspension system.

How does regenerative suspension work?

For traditional suspension, the other part of vibration energy will be transferred to heat by the damping oil; for regenerative suspension, however, a large part of other energy can be harvested and converted into electricity or other useful energy, as shown in Fig. 11.

What is vehicle suspension energy harvest potential?

A model is built to characterize the oil temperature-rise and damping change. Different types of vehicle suspension energy harvest potential are explored. Vehicle suspension vibration can cause damping oil temperature-rise, which further effects the suspension performance, rapids the suspension failure, and goes against the vehicle fuel efficiency.

Does suspension vibration affect fuel efficiency?

Vehicle suspension vibration can cause damping oil temperature-rise, which further effects the suspension performance, rapids the suspension failure, and goes against the vehicle fuel efficiency. This paper focuses on the suspension

vibration energy conversion mechanism and energy harvest potential analysis.

What is a magnetically suspended flywheel energy storage system (MS-fess)?

The magnetically suspended flywheel energy storage system (MS-FESS) is an energy storage equipment that accomplishes the bidirectional transfer between electric energy and kinetic energy, and it is widely used as the power conversion unit in the uninterrupted power supply (UPS) system.
