Technology analysis of energy storage shaft

Overview

This paper investigates the potential of using gravity energy storage with suspended weights as a new technology for redeveloping abandoned deep mine shafts. The technology has relatively low energy density.

Can gravity energy storage be used to redevelop abandoned mine shafts?

This paper has investigated gravity energy storage using suspended weights as a new technology for redeveloping abandoned deep mine shafts. It has been shown how to size the suspended weight to maximize the energy storage capacity for a mine shaft, given its physical dimensions.

How many mine shafts have a potential energy storage capacity?

The maximum recorded depth for any of the shafts is 1040 m and the maximum recorded diameter is 7.55 m. Fig. 5. The number of mine shafts (for which depth and diameter information is available) with potential energy storage capacities above different levels. 340 mine shafts have a potential energy storage capacity above 1 MWh. Fig. 6.

Do energy shafts have a long-term performance and durability?

Future research on the long-term performance and durability of energy shafts will build upon existing findings to achieve greater depth. Numerical simulations will be employed to evaluate the impact of environmental factors such as seasonal heat accumulation and groundwater level fluctuations, while simultaneously optimizing maintenance strategies.

Is the energy shaft better than the energy tunnel?

Through the analysis of thermal conductivity and specific heat capacity of soft soil in the Shanghai stratum and surrounding rock in the Beijing stratum, it is evident that the heat transfer performance of the energy shaft is superior to that of the energy tunnel.

Does the energy shaft have a superior heat exchange capacity?

Specifically, the temperature differential at the inlet of the heat exchange pipe

in the energy shaft is 235% greater per unit time compared to that in the energy tunnel. This finding suggests that the energy shaft possesses a superior heat exchange capacity. Variation of outlet temperature (a) and difference of outlet temperature per unit time (b).

How much energy does a mine shaft provide?

However, the relative share of the energy capacity which is provided by mine shafts with energy capacities above 1 MWh actually decreases slightly, from 76.9% at 3150 kg/m³ (cement), to 73.1% at 8050 kg/m³ (steel).
